

Using automatically generated scripts in higher level optimization problem definitions

Mika Vuolle

MOBO with IDA

- Optimization program which can be coupled with any simulation program that uses ASCII input and output files.
- An IDA ICE model can be simulated and altered using IDA's own script language, where MOBO places numerical parameter values.
- MOBO reads output data from `ida_lisp.end` and gives new input values.

Optimization process

Traditional way

- Add delimiters into an input file
 - Single zone default ICE case =>
 - *3727 lines*
 - *Total no of variables 4315*
 - Change of an overhang depth makes multiple changes

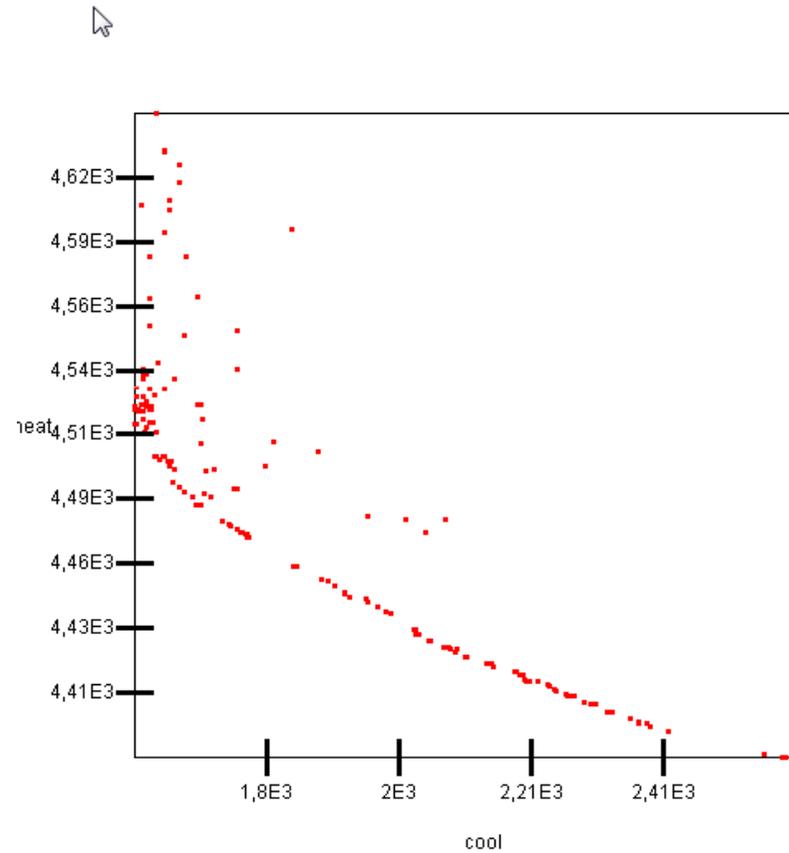

- *For example*

```
TRANSTOT 0.0 0.0 0.0 0.9599 0.8317 0.73479 0.71152 0.73479 0.8317
0.9599 0.0 0.0 0.0 0.0 0.0 0.88848 0.73214 0.52418 0.36855
0.34197 0.36855 0.52418 0.73214 0.88848 0.0 0.0 0.98076 0.86016
0.71868 0.5232 0.23496 0.02662 0.0 0.02662 0.23496 0.5232 0.71868
0.86016 0.98076 0.0 0.70894 0.54889 0.32188 0.12159 0.00275 0.0
0.00275 0.12159 0.32188 0.54889 0.70894 0.0 0.0 0.54411 0.36453
0.18926 0.0591 0.0 0.0 0.0 0.0591 0.18926 0.36453 0.54411 0.0
```

ICE script

```
(:UPDATE [@]
((EXTERNAL_SHADING :N "External shading 1")
((SIMPLE-SCREEN :N "Screen")
(:PAR :N VERTICES :S '(:DEFAULT #S(MS-SPARSE DEFAULT-VALUE NIL DIMENSION 2 VALUE NIL) 2))
(:PAR :N (VERTICES 2 1) :V 1)))
(:ADD (AGGREGATE :N THREE-D-MODEL :T THREE-D-PLAN)
((AGGREGATE :N VIEWPT :T VIEWPOINT)
(:PAR :N POSITION :V #(71.2372535551286 -60.3583827748382 18.5095801927414))
(:PAR :N FOCALPOINT :V #(25.0 8.99749946594238 2.5))))))
```
